

HEPA Filter Compliance Solution

Client Focus Areas & Demo Alignment — Jubilant HollisterStier

This document maps Jubilant HollisterStier's stated areas of interest to the Oxmaint HEPA filter compliance solution, and defines what the demo and any subsequent implementation should be able to show against each area. It supplements the Master Data Reference and Technical Implementation Guide previously prepared for this engagement.

1. Stated Areas of Focus

Per Jubilant HollisterStier's brief, the team's primary interests are:

- Electronic management and electronic storage of HEPA certification/testing documentation — including ease of access, record retention, reporting capabilities, and audit readiness.
- Integration with SAP, the client's current CMMS platform — including work order management, document linkage, asset records, and data synchronization.
- HEPA certification document lifecycle management — workflow routing, document review and approval, electronic signatures, audit trail capabilities, record retention, compliance monitoring, and automated notifications for upcoming certification or documentation requirements.

2. Focus Area 1 — Electronic Document Management & Storage

2.1 What the demo should show

- Centralized digital repository for all DOP/PAO test certificates, leak detection records, and replacement/chain-of-custody records — one system of record instead of paper or disconnected files.
- Search and retrieval by filter ID, cleanroom, date range, technician, or test outcome, targeting the sub-15-minute retrieval benchmark (vs. 4-7 days manual search).
- Configurable record retention periods aligned to regulatory requirements (FDA, EU GMP, and any HollisterStier internal retention policy), with retention counters visible per record and legal-hold override capability.
- Standard and ad hoc reporting: compliance-by-cleanroom, overdue-tests, pass/fail trend, and pre-built FDA/EU GMP audit export packages generated in under 2 hours.
- Role-based access control so Quality, Manufacturing, and site leadership see the views relevant to their role without exposing edit rights to locked records.

2.2 Questions to confirm with HollisterStier

- Required retention period(s) by record type (e.g., filter test records vs. batch-related documentation) — regulatory minimum vs. internal policy.
- Existing document repository or QMS (e.g., Veeva, MasterControl, TrackWise) that HEPA records currently live in, if any, and whether migration or coexistence is expected.
- Specific report formats auditors or internal QA currently expect to see.

3. Focus Area 2 — SAP Integration (CMMS)

3.1 Integration scope

HollisterStier's SAP instance is the system of record for maintenance/CMMS today. The relevant integration points are:

Capability	Direction	What synchronizes
Asset master data	SAP → Oxmaint (or bi-directional)	Filter/equipment asset records, functional location, ISO classification, install date — avoids duplicate asset entry
Work order management	Bi-directional	SAP work orders trigger or receive HEPA test/leak/replacement tasks; completion status and readings sync back to SAP
Document linkage	Oxmaint → SAP	Test certificates, leak reports, and replacement records attached

		or linked to the corresponding SAP equipment/work order record
Data synchronization	Scheduled or event-based	Filter status, test results, and compliance flags kept consistent between both systems to avoid a second source of truth

3.2 Integration approach

- Standard integration methods: SAP PI/PO or SAP Cloud Integration middleware, OData/REST APIs, or IDoc-based exchange, depending on HollisterStier's SAP version (ECC vs. S/4HANA) and existing integration landscape.
- Recommended pattern: SAP remains system of record for the equipment master and work order lifecycle; Oxmaint acts as the compliance-record and testing-workflow layer, pushing completed test/leak/replacement documentation back to the linked SAP object.
- Sync should be near-real-time for status/compliance flags (so SAP work order status reflects true filter condition) and can be batch/scheduled for bulk historical or reporting data.

3.3 What the demo should show

- A representative filter asset shown in both systems with the same identifier, demonstrating no duplicate data entry.
- A mock SAP work order that triggers a HEPA test task in Oxmaint, and the completed test record linking back to that work order.
- Illustration of how a sync failure or conflict would be surfaced (not silently dropped).

3.4 Questions to confirm with HollisterStier

- SAP version/module in use (ECC vs. S/4HANA; Plant Maintenance module scope) and available integration middleware.
- Who owns the SAP integration technically — internal IT, SAP Basis/PI team, or a third-party integrator — and typical timeline for standing up a new interface.
- Whether SAP or Oxmaint should be considered the system of record for compliance status in the event of any discrepancy.

4. Focus Area 3 — HEPA Certification Document Lifecycle Management

4.1 Lifecycle stages to demonstrate

Stage	Capability	Compliance basis
Creation	Test/leak/replacement record created from mobile field entry or template	21 CFR Part 11
Workflow routing	Configurable routing to the correct reviewer/approver based on record type, cleanroom, or result (e.g., a Fail routes to Quality automatically)	cGMP change control principles
Review & approval	Reviewer sees full record and supporting data before approving; rejection routes back with comments	21 CFR Part 11 / cGMP
Electronic signature	Signer identity, meaning of signature (e.g., "reviewed and approved"), and timestamp captured per signature event	21 CFR Part 11 Subpart C
Audit trail	Immutable log of every creation, edit, routing, and signature event, attributable to a named user and timestamp	21 CFR Part 11
Record retention	Retention period enforced per record type; records cannot be deleted before retention expiry; legal hold override	ISO 14644 / internal QA policy
Compliance monitoring	Dashboard view of records in each lifecycle stage, overdue approvals, and aging documents	Internal quality oversight
Automated notifications	Alerts ahead of upcoming certification/testing due dates, and escalation if a review/approval step is overdue	ISO 14644 scheduling intervals

4.2 What the demo should show

- A single test record moved through creation → routing → review → e-signature approval → locked/audit-ready state, with the audit trail visible at each step.
- A deliberately failed test routed automatically to a reviewer, showing routing logic is condition-based, not manual triage.
- An electronic signature event showing signer identity, role, and signature meaning captured alongside the timestamp.
- The notification/escalation view: an upcoming test due in N days, and an overdue approval escalated to a manager.

4.3 Questions to confirm with HollisterStier

- Current approval hierarchy for HEPA test records (single reviewer, or multi-step QA + Manufacturing sign-off).
- Preferred notification channel(s) — in-app, email, or integration with an existing alerting system.
- Any existing electronic signature infrastructure (e.g., an existing 21 CFR Part 11-validated e-signature system) that should be reused rather than duplicated.

5. Summary — Demo Coverage Checklist

- [] Centralized document repository walkthrough with search/retrieval and retention counters
- [] Sample FDA/EU GMP audit export generated live
- [] SAP-side asset record shown alongside its Oxmaint counterpart (same identifier)
- [] SAP work order triggering an Oxmaint test task, and the completed record linking back
- [] Full document lifecycle demo: creation → routing → review → e-signature → locked audit trail
- [] Compliance monitoring dashboard showing records by lifecycle stage and overdue items
- [] Automated notification example for an upcoming certification due date and an overdue approval

6. Reference

This brief should be read alongside HEPA_Master_Data (solution overview, ROI, competitive positioning) and HEPA_Technical_Implementation_Guide (data model and build checklist). The accompanying HEPA_Sample_Dataset workbook includes illustrative SAP integration mapping and document lifecycle records reflecting the areas above.
